Subject: Fourth Quarter 2007 Performance Report for the TIA Managed Portfolio.
Date: Tuesday, January 01, 2008 6:26:00 PM

Dear Clients of Trusskey Investment Advisors (TIA),

As of the end of the fourth quarter of 2007, the TIA Managed Portfolio has outperformed the major indexes. The application of the EAB portfolio theory is working just as it should. Our money has been safely sitting in Money Market Funds for 310 of the 365 days this year! ***"The more your money is out of the market and sitting in money market funds, the less your risk of loosing it!"***

This means that the TIA Managed Portfolio was exposed to the market volatility for only 55 days during the entire 2007 year and it still outperformed the major indexes.

Dow Jones Index	**+ 6.43 %**
S& P 500 Index	**+ 3.53 %**
TIA Managed Portfolio	**+ 12.56 %**

Notes to percentage figures:
1. The TIA Managed Portfolio has had management fees deducted from the results. 2. No fee's have been applied to the indexes. 3. Index values published by Standard and Poors and Dow Inc. and do not include reinvested dividends. 4. Any deposits or withdrawals will affect your personal account's net gain or loss during the referenced period. 5. A clients assets would have had to be invested for the entire calendar year to receive the "net" performance percentage stated above.

For record purposes, this email is being sent to all clients of record on the date of emailing if they have a valid email address on file.

Keep Smiling,

Matthew M. Trusskey

If you wish to calculate the performance of an account to find your year to date results, here is the formula. Start with your end of the quarter balance (minus any front or rear sales charges to purchase or liquidate the account). Take this figure and minus the beginning of the year balance from it. Then take the resulting figure and divide it by the beginning of the year balance. The result will be your net performance for the year to date period. It is very important to compare the risk you took to make the net performance as well. *Remember that you can double your money in a few seconds in Las Vegas.* (Note: remember that if you had any deposits or withdrawals during the calculated period, this will skew your results.)
